

```
boost::statechart::  
event< EvTransitionOnError  
Failure< TSourceObject,  
    TOrthogonal > >
```

The diagram shows a class hierarchy. The base class, `boost::statechart::event< EvTransitionOnErrorFailure< TSourceObject, TOrthogonal > >`, is represented by a white box with a black border. It has three horizontal compartments: the top one for the class name, and two empty ones below it. The derived class, `cl_lifecyclenode::EvTransitionOnErrorFailure< TSourceObject, TOrthogonal >`, is represented by a gray box with a black border, also with three horizontal compartments. A blue arrow points from the top compartment of the derived class to the bottom edge of the base class box, indicating inheritance.

```
cl_lifecyclenode::EvTransition  
OnErrorFailure< TSourceObject,  
    TOrthogonal >
```
